When A Rocker Stamp is Required

When a rubber stamp approaches 3" x 3" or there is a need to stamp on a curve surface it is time to think about a rocker stamp. A large flat mounted stamp would make it hard to produce a good full image. You would have to press down hard on the center of the stamp to achieve full image contact, and each impression would take more time and exertion to produce.

Photo 1 is 5.5" x 5.625" high, and is design to stamp on a flat surface. With this rocker stamp you are able to apply even pressure across the mount producing a good image with minimal time and effort.

Photo 2 has three small rocker peg stamps design for stamping on a curve surface in limited space.

Photo 3 is not a rocker stamp but a peg stamp with curve text design to be stamped on a flat surface within a restricted space on a gear.

Photo 4, a rocker stamp with a ribbed cushion to accommodated changeable RIBtype® dies.
